Las Vegas, NV

Company overview

Halvorune LLC delivers technical services to federal agencies, prime contractors and commercial clients. Software engineering is its core practice: modernizing legacy applications, putting cloud infrastructure under version control, and building secure data pipelines and accessible web applications. Its founder brings more than eleven years of enterprise experience in regulated industries.

Core competencies

- **Application modernization.** Move legacy applications onto current, supported platforms without a rewrite-from-scratch gamble.
- **Cloud infrastructure as code.** Cloud environments defined in version-controlled code, so every change is reviewed, repeatable and recorded.
- **Data pipelines and integrations.** Reliable, secure movement of data between your systems, partners and vendors.
- **Efficiency and automation.** Find the slow, manual and wasteful parts of your systems and processes, and streamline them.
- **Logging and observability.** Centralized logs and alerts that tell you something broke before a user does.
- **Web application development.** Responsive, accessible web applications for public and internal users.
- **Technical assessment and delivery advisory.** An independent read on a system or a program, and a plan you can act on.

Differentiators

- **Regulated-industry discipline.** Change control, testing and audit trails built into delivery, from more than eleven years in enterprise environments.
- **Accessible by default.** Interfaces built and tested to Section 508 and WCAG 2.2 AA from the first component.
- **Everything as code.** Infrastructure defined in version-controlled code, with automated tests and written runbooks, so the government or client owns a system it can operate.
- **Agile delivery.** Certified ScrumMaster; short, reviewable increments with plain-language status reporting.

Founder experience

- Designed and deployed automated data storage and centralized logging in the cloud, with the infrastructure defined as code, to make production systems easier to scale and to monitor.
- Engineered a high-throughput data pipeline that securely delivers data to outside vendors for automated downstream calculations.
- Led an enterprise-wide upgrade of legacy applications to a current, supported framework while serving as the team's Certified ScrumMaster.
- Applied modern, AI-assisted tooling to accelerate the modernization of existing code and systems, and improved the efficiency of systems already in production.

Education: B.S. Computer Engineering, Milwaukee School of Engineering. Certified ScrumMaster.
